

IT ENTERPRISE ARCHITECTURE

This procedure is governed by its parent policy. Questions regarding this procedure are to be directed to the identified Procedure Owner.

Category:	E. Information & Technology Management
Parent Policy:	E01
Approval Date:	November 30, 2023
Effective Date:	November 30, 2023
Procedure Owner:	Director, Information Technology

Overview:	<p>This procedure encompasses the following individual domains that form Enterprise Architecture:</p> <ol style="list-style-type: none"> 1. Business Architecture 2. Data Architecture 3. Application Architecture 4. Technology Architecture 5. Information Security Architecture
Procedures:	<p>The Enterprise Architecture principles will guide the selection, design and implementation of business solutions for the following three aspects of information, applications and technology. All principles are interrelated and collectively applied to:</p> <ol style="list-style-type: none"> 1. Provide a framework within which Olds College of Agriculture & Technology (the "College") makes informed and considered decisions about Digital Solutions and Information Technologies. 2. Establish evaluation criteria for the selection of products or product architectures. 3. Define the functional requirements of Enterprise Architecture. 4. Assess existing digital solutions, IT systems and the future strategic portfolio for compliance with the defined architectures. 5. Support governance activities related to the College's Enterprise Architecture. <p>Business Architecture Principles The following principles apply to Business Architecture:</p> <ol style="list-style-type: none"> 1. Decisions are made with the intention of achieving maximum benefit to the College. 2. Technology will be centralized to maximize efficiencies and sustainability. 3. Technology decisions are based as business solutions in preference to solution decisions.

4. Enterprise operations are designed with sufficient resiliency to ensure a high probability of continued operations.
5. Applications are developed for use across the enterprise in preference to similar or duplicative applications which are used in a particular department.

Data Architecture Principles

The following principles apply to Information Architecture:

1. Information is a valued corporate resource and is managed accordingly.
2. Data is accessible and shared for users to perform their functions.
3. Each data element has an Information Data Custodian accountable for data quality.
4. Data is defined consistently across the College and the definitions are understandable and available to all users.
5. Information is protected from unauthorized use and disclosure.

Application Architecture Principles

The following principles apply to Application Architecture:

1. Applications are independent of specific technology choices and therefore can operate on a variety of technology platforms.
2. Applications are easy to use and the underlying technology is transparent to users so they can concentrate on tasks at hand.

Technology Architecture Principles

The following principles apply to Technology Architecture:

1. Changes to applications and technology are only made in response to business needs.
2. Changes to the enterprise information environment are planned and implemented in a timely manner.
3. Technological diversity is controlled to minimise the non-trivial cost of maintaining expertise in and connectivity between multiple processing environments.
4. Software and hardware conforms to defined standards that promote interoperability for data, applications and technology.

Information Security Architecture Principles

The following principles apply to Information Security Architecture:

1. Systems and digital solutions are in compliance with the Digital Security Procedure and associated standards.
2. Systems integrate with the College's endorsed identity management system and single sign-on (including multi-factor authentication) solution wherever possible.

Generally, the College will endeavour to provide intuitive and seamless user experiences on all online systems. Systems are designed to be simple to use, effective and as automated as possible.

Definitions:

Application Architecture: A structural map of how an organization's software applications are assembled and how those applications interact with each other to meet business or user requirements.

Business Architecture: Represents holistic, multi-dimensional business views of capabilities, end-to-end value delivery, information, and organizational structure; and the relationships among these business views and strategies, products, policies, initiatives, and stakeholders.

	<p>Data Architecture: Defines an organization’s business information assets, as well as the assets’ sources, structure, classification, and associations. Information architecture enables understanding and utilizes enterprise data and analytic assets to achieve desired business outcomes.</p> <p>Information Security Architecture: Describes the structure and behavior for an enterprise’s security processes, information security systems, personnel and organizational subunits, showing their alignment with the enterprise’s mission and strategic plans.</p> <p>Technology Architecture: Describes the logical software and hardware capabilities that are required to support the deployment of business, data, and application services. This includes IT infrastructure, middleware, networks, communications, processing, standards, etc.</p> <p>Information Data Custodian: This responsibility sits with specific Information Technology Department designates. Data custodians are responsible for safe custody, transport, storage of the data and implementation of associated business rules.</p>
